Installation:

Configuration Options

☑ Change default post category name from "uncategorized" to: [General]

☑ Change default blogroll category name from "blogroll" to: [Related]

☑ Turn OFF organization of uploads into month and year-based folders.

☑ Set the RSS feed to display only a summary.

☑ Change permalink structure to custom setting: [/%category%/%postname%/]

We've checked this permalink box by default because it's important, but if your .htaccess file is not writable, then you'll get an error message telling you so. If you do get the error message, there's no harm done, but your permalinks will not be changed and you should make the file writable and try again.

☑ Add the page and shortcode for the integrated DDSiteMap Generator, giving you a static sitemap that changes as you add content. Look under WP Admin > Settings for additional DDSiteMap options.
(Not an XML sitemap)

Sitemap Generator: ● On ○ Off (On by default.)
This plugin creates a static sitemap (not to be confused with an XML sitemap) for your WordPress site. Simply placing the shortcode <!-- ddsitemapgen --> in your .html will show the options you've selected in your admin, so the spiders and bots have a path to crawl each page and post.
Access under Settings > DDSitemapGen
